Data and Method

About the data

Source: IBM HR Analytics Employee Attrition dataset. This is sample data created by IBM, not a real company. It has 1,470 employees, and 237 of them left (16.1%). There are no missing values. I removed 6 columns that were not needed. The data has no dates, so changes over time cannot be shown.

How the risk score works

Each employee gets 1 point for each of 6 risk factors: works overtime, is under 30, earns under 3,000 a month, has been at the company under 2 years, is single, and travels frequently. A score of 0-1 is Low, 2-3 is Medium and 4-6 is High. In this dataset, High-risk employees left 68.2% of the time, Medium 23.1% and Low 6.7%. The list is meant to start supportive conversations about pay, workload and growth, not to judge people.

Key findings

Overtime: employees who work overtime left 30.5% of the time, against 10.4% without it. Early career: under-25s left 39.2%, and people in their first 2 years left 34.9%. Pay: those earning under 3,000 a month left 28.6%. Role: Sales Representatives left 39.8%, the highest of all roles. Travel and marital status: frequent travellers left 24.9% and single employees 25.5%.

Limits and next steps

This is sample data, so the results show the method, not a real company. The cost figure assumes that replacing a leaver costs 50% of their yearly salary. That is an assumption, not part of the data, and the data does not state the currency. The risk score was built and checked on the same data, so it would likely be less accurate on new employees. Some groups are small, so read those rates with care. The charts show links, not proven causes. The data has no dates, so trends over time cannot be shown. Next step: test the score on unseen data using Python.

Recommended Actions

1. Review overtime

Employees who work overtime left 30.5% of the time, against 10.4% without it. Also, 53.6% of all leavers worked overtime, though only 28.3% of employees do. Suggested action: review workloads in roles with a lot of overtime, and track overtime hours each month.

2. Support the first two years

Employees in their first 2 years left 34.9% of the time, and those under 25 left 39.2%. Suggested action: set up a clear onboarding plan, give each new joiner a mentor, and hold check-ins at 3, 6 and 12 months.

3. Review pay in low-paid roles

Employees earning under 3,000 a month left 28.6% of the time, and Sales Representatives left 39.8%. Suggested action: compare pay with the market for these roles, and review their career paths and promotion options.

4. Check in with high-risk staff

28 current employees have a High risk score (4 or more). Suggested action: managers hold supportive conversations about workload, pay and growth, and the score is re-run every quarter. The list should help people, not be used to judge them.
